**“SLIMMING DOWN THE WEIGHING PROCESS”**

**SASKATOON: Massload Technologies is now offering their highly successful Ultraslim Weighpads with wireless communication. Wireless weighing on a portable pad only 0.7” thick is the newest convenience in axle and wheel weighing applications. Your scale can be connected to an indicator without interference from wires; just lay out the pads and you are ready to weigh.**

**With 20 independent micro loadcells in each pad, the Ultraslim is our most sophisticated pad to date. The system can support up to eight channels and has a battery life of up to 200 operating hours. The benefits of this system are endless. There is no longer a need to fuss with cabling in and around the weighing area, allowing the application to run quickly, conveniently and without interruption.**

**There are many wireless display options available for the Ultraslim Weighpad. The options include; a Palm Powered™ handheld using Massload software, an industry standard readout or a laptop and full page printer housed in a NATO approved carrying case. The laptop within the case uses Massload’s specially designed Wireless Desktop software and is capable of obtaining readings from up to 8 channels. There are many other options available with this new system and Massload Technologies can always custom design a system to fit your application needs.**
